Table of Contents

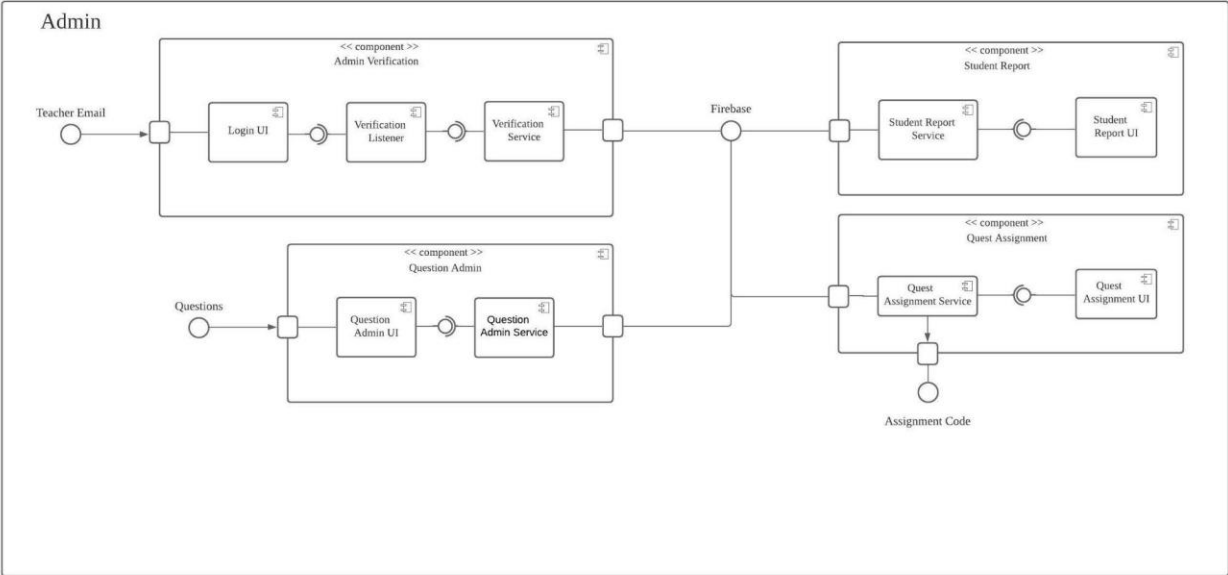

1 Static Models (Component Diagrams)	3
2 Dynamic Models (Communication Diagrams)	5
3 Data Persistence Design (Entity-Relationship Diagrams)	7
4 Component Implementation (Code with documentation)	8
5 Test Cases	9
5.1 Game Interface	9
5.2 Admin Interface	18

1. Static Models (Component Diagrams)

The static models focus on the organisation and structure of the system. The component diagrams show the dependencies between the various software components of the system. The overall component diagram shows the dependencies between the system backend and the game or admin interface. The second and third diagrams show the dependencies between different components found within the Game and Admin system respectively.

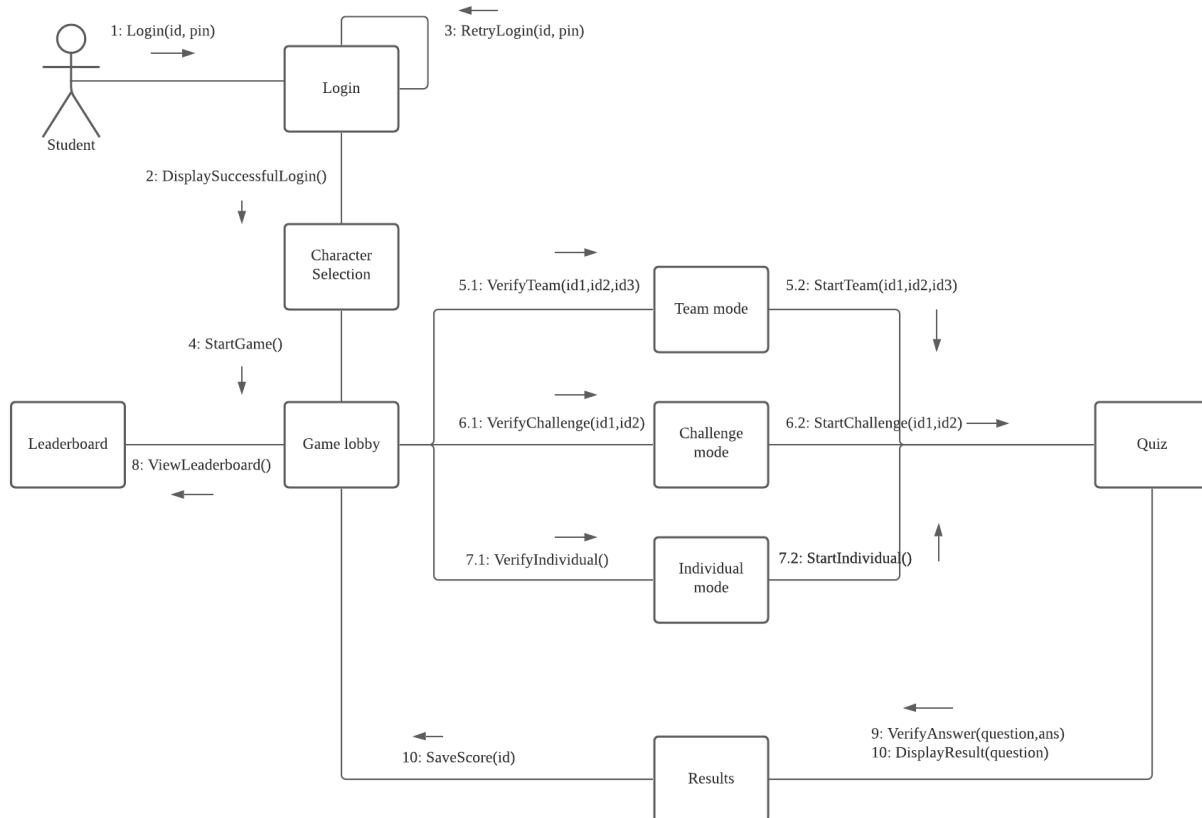

Overall Component Diagram

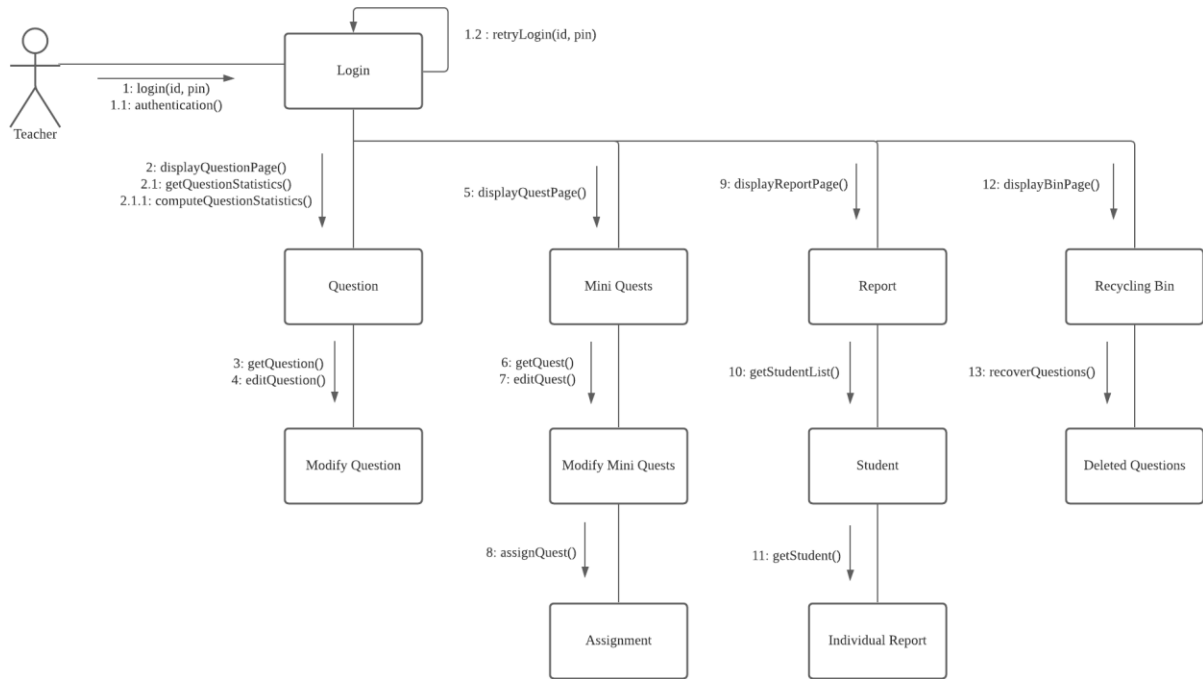

2. Dynamic Models (Communication Diagrams)

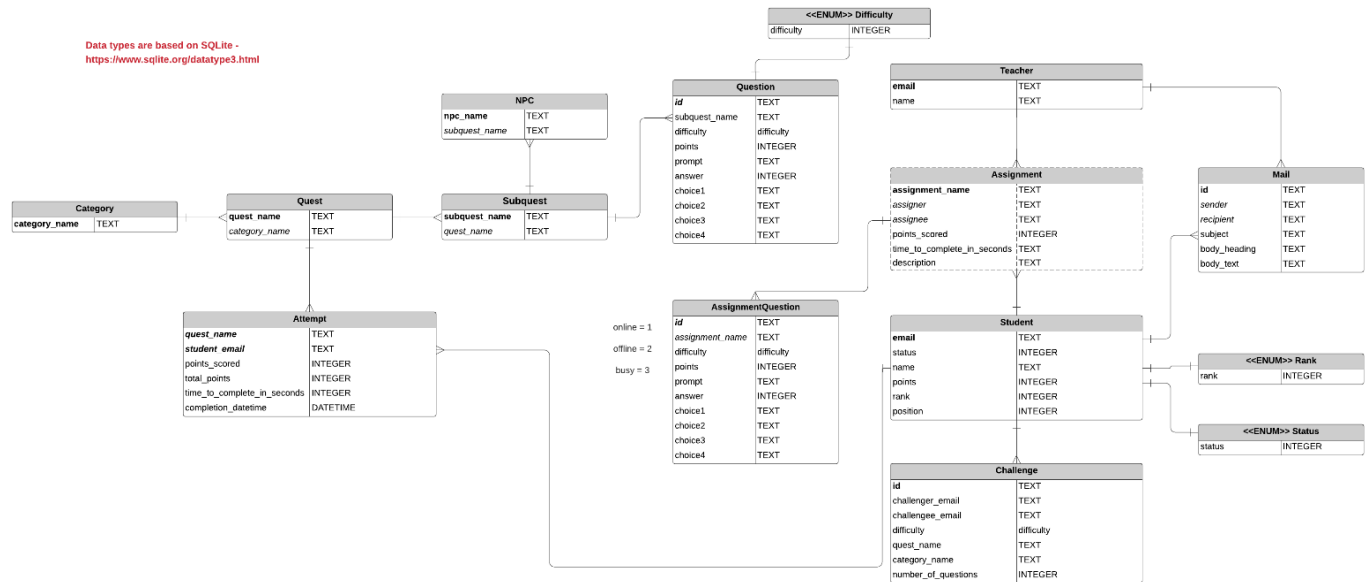

The dynamic model focuses on the behavior of the system. The communication diagram shows the exact messages/requests being shared between the various client and supplier objects in the process. Message text is prefixed by sequence numbers, which indicates the time order of the message. Messages with decimal points are messages nested under the parent message. The top-level message, i.e. Login is numbered 1 for both teacher and student communication diagrams.

3. Data Persistence Design (Entity-Relationship Diagrams)

The Entity-Relationship Diagram shows the relationship between the data elements stored in the database of our system. Each data element in the diagram is an object, with its attributes and corresponding data type defined in the diagram. The diagram provides a visual reference for database design and implementation and helps determine system requirements.

4. Component Implementation (Code with documentation)

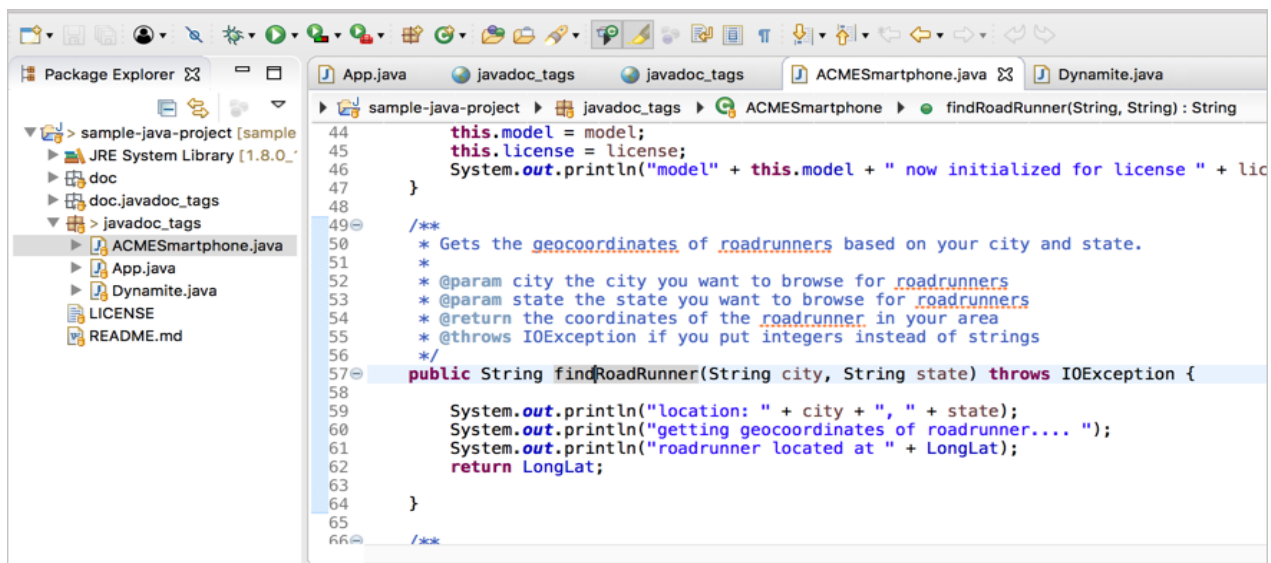

For our backend API used by both the Game interface and the administration user interface, the implementation can be found on [GitHub](#) which also happens to be our main tool for source code and version control. Our API is deployed using Okteto Cloud and can be found [here](#).

The implementation for our Admin interface used by teachers can also be found on [GitHub](#) in another branch as we are using [Git Branch Workflow](#) to manage the development of this huge project with many interfaces and within each interface, many different features to meet the plethora of requirements specified in our Software Requirement Specification document. A branch in our repository represents a feature being developed by a fellow groupmate, only to be merged into the main branch once it is well tested and ready to be integrated into the project.

On the other hand, our Game interface implementation is not found on Github but on Unity Collaborate, which is our alternative tool for source control and version control optimized for Unity based projects. At the end of our project, we will separately attach the source code for our game in another file and link it in the documentation for your perusal.

For both the Game interface and Admin interface, the source codes are both well documented in a format similar to Javadoc as it is clear, concise and thorough, which will give other developers quick context on any particular class, method or segment of the code, speeding up their understanding of the source code and hence the overall development process from even newer or junior members of the team in the setting of a professional software engineering team.

Relevant documentation for all interfaces has been exported to html files to provide a nice user interface for developers when they are referring to documentation. Click [here](#) to access documentation (not uploaded to MediaWiki as files were too huge >8MB). On Github, directories labelled `docs.zip` or `doc.zip` are likewise zipped up folders of our documentation which you can unzip and refer to.

5. Test Cases

For our game, we have tested the functionalities of every subsystem that exists across all platforms and interfaces. Below, you can observe a compilation of all of our testing that we have carried out and completed: each table represents the system being tested and each row within the table represents the test case, containing information on the inputs, expected results and actual results.

For each interface, we used the following open-sources softwares to write the respective platform's test cases, allowing us to validate the functionality and behavior of our scripts:

- Admin interface: Jest and Enzyme
- Game interface: Unity Testing Framework
- Backend API: Pytest

5.1 Game Interface

Verification Scene

Get verification code

Email Account	Expected result	Actual result
	Empty input	Empty input
abc123	Invalid email	Invalid email

Backend updated as follows: add 1000 to challenger total point attained in game, update challenger rank if necessary, update leaderboard if necessary, update challenger challenge history if necessary

Storyline

Update player progress

PlayerProgress	Completed	Expected result	Actual result
World 1, Section 1, Level 3	World 1, Section 2, Level 1	Updates player progress to reflect the new section. World 1, Section 2, Level 1	Updates player progress to reflect the new section. World 1, Section 2, Level 1
World 1, Section 5, Level 3	World 2, Section 1, Level 1	Updates player progress to reflect the new world. World 2, Section 1, Level 1	Updates player progress to reflect the new world. World 2, Section 1, Level 1
World 1, Section 1, Level 3	World 1, Section 1, Level 3	Does not update player progress. Updates player score for World 1, Section 1, Level 3	Does not update player progress. Updates player score for World 1, Section 1, Level 3

Solo Mode

Check player progress

PlayerProgress	SectionDifficulty	Expected result	Actual result
World 1, Section 1, Level 1	World 1, Section 1, Level 1	True	True
World 1, Section 1, Level 1	World 2, Section 1, Level 1	False	False
World 1, Section 1, Level 1	World 1, Section 2, Level 1	False	False
World 1, Section 1, Level 1	World 1, Section 1, Level 3	False	False

Challenge Mode

Process winner - where PlayerA_Score and PlayerB_Score are the number of questions that player A and player B answered correctly, respectively.

PlayerA_Score	PlayerB_Score	Expected result	Actual result
---------------	---------------	-----------------	---------------

3	2	"Win" notification is sent to player A & points are given. "Lose" notification is sent to player B.	"Win" notification is sent to player A & points are given. "Lose" notification is sent to player B.
2	3	"Win" notification is sent to player B & points are given. "Lose" notification is sent to player A.	"Win" notification is sent to player B & points are given. "Lose" notification is sent to player A.
3	3	"Tie" notification sent to both players. Points are given to both players.	"Tie" notification sent to both players. Points are given to both players.

Update SoloHistory - handles cases where a quiz has been successfully completed. Thus, world and section are valid.

PlayerProgress	SectionDifficulty	Expected result	Actual result
World 1, Section 1	World 1, Section 1	Score is <u>added</u> to SoloHistory, World 1, Section 1	Score is <u>added</u> to SoloHistory, World 1, Section 1
World 1, Section 1	World 1, Section 2	Score is set for SoloHistory, World 1, Section 1	Score is set for SoloHistory, World 1, Section 2

Update ChallengeHistory

Challenge	ChallengeSelected	Expected result	Actual result
World 1, Section 1	World 1, Section 1	Score is <u>added</u> to ChallengeHistory, World 1, Section 1	Score is <u>added</u> to ChallengeHistory, World 1, Section 1
World 1, Section 1	World 1, Section 2	Score is set for ChallengeHistory, World 1, Section 1	Score is set for ChallengeHistory, World 1, Section 1

Check AssignmentHistory
